

Gil L Bueno

Principal Software Engineer

gilbueno.mail@gmail.com Telegram Github LinkedIn x.com/melanke Sao Paulo, Brazil (UTC-3)

I am a Principal Software Engineer with 19+ years designing and delivering scalable backend systems, distributed applications and enterprise software, with 50+ delivered projects across logistics, fintech, media, enterprise SaaS and Web3. I architected a logistics platform that processed 50M+ invoices for 60,000 couriers, and a wallet application that moved more than \$1 billion in volume.

My core expertise is Java, Kotlin, Node.js and TypeScript — REST and GraphQL APIs, distributed systems, and solution architecture. I have led engineering teams of up to 30 people while staying hands-on in design and implementation, defining architecture, technical roadmaps, engineering standards and delivery processes.

More recently I have worked on AI-assisted engineering workflows, integrating LLM agents into development and review processes and building tooling that turns natural language into working software, and on Web3-enabled applications, building backend services, wallet infrastructure, multi-chain integrations and developer tooling. What I care about is shipping systems that stay reliable in production.

Notable Achievements

- Neon Wallet – Over US\$1 Billion in traded volume
- Runin Multilaser – Embedded in over 20 Million devices
- iTrack – 50 Million invoices registered; 60k delivery mans; 2k companies
- Apptite – US\$1.6 Million in GMV; 100k deliveries; 50k users
- Sharity – R\$ 2 Million in donations; 100k users
- Desabafa - 700k posts

Technical Skills

• Backend

Java / Kotlin (Since 2008), **Node.JS / TypeScript** (Since 2012),
REST / GraphQL / WebSockets / Microservices (Since 2018), **MySQL / PostgreSQL / MongoDB / Prisma** (Since 2007)

• Web Frontend

Javascript (Since 2008), **Typescript** (Since 2018), **ReactJS / NextJS** (Since 2017), **Tailwind** (Since 2020)

• AI Engineering

AI Process Automation (Since 2025), **Agent Development / MCP / Skills** (Since 2025),
Harness Engineering (Since 2026), **Spec-Driven Development** (Since 2025)

• Web3

Ethereum / EVM / Multi-chain Integration (Since 2018), **Wallet Infrastructure / WalletConnect** (Since 2021),
Ethers / Wagmi / Viem / The Graph (Since 2023), **Solidity / Foundry** (Since 2020)

Work Experience

33Labs • Software Engineer • Sep 2025 - current

At 33Labs (formerly 33Audits), I design and implement scalable backend services and application architecture for decentralized financial products.

The company began as a security auditing firm, which gave me daily experience preventing vulnerabilities in production systems. I work end to end — architecture, implementation, and automated testing — with security engineers involved throughout. This led me to a key conviction: review should start at the architecture stage, before any code is written. To support it, I built developer tooling and AI-assisted workflows that improved the team's productivity.

<https://www.33labs.ai/>

American Spend • Software Engineer • Mar 2026 - May 2026

American Spend is a high-throughput financial platform combining yield generation with market-based price discovery.

Designed the backend architecture, including a hybrid market model that transitions between two distinct operating phases.

<https://spend.market/>

Mosaic • Software Engineer • Sep 2025 - Feb 2026

Mosaic is a developer platform designed to make application development more accessible, cost-efficient, and secure through flexible, pre-audited, and composable components, with AI-assisted tooling for generating compositions from natural language.

Designed reusable backend components and contributed to the core architecture of the platform.

Built modular application services focused on scalability and maintainability, including a workflow for automated liquidity and price discovery.

Improved developer productivity through automation and AI-assisted tooling.

Collaborated on architecture decisions for distributed applications and developed abstractions supporting modular, extensible services.

Simpli • Software Engineer | CTO • Oct 2013 - May 2025

Over 11 years I led engineering teams of up to 30 developers, including 5 team leads, and delivered 50+ production software projects — distributed enterprise systems for logistics, fintech, media, education and SaaS clients, plus our own proprietary platforms. I defined software architecture, technical roadmaps, engineering standards and delivery processes, and built scalable backend services using Java, Kotlin, Node.js, TypeScript, MySQL/PostgreSQL and REST/GraphQL APIs.

Simpli started as a startup building a B2C mobile product and pivoted within its first year into a software house delivering custom distributed applications, scaling organically through consistent delivery and client satisfaction. I played a key role in shaping both the technical direction and the business strategy, ranging from hands-on technical leadership to driving innovation through research, process design and early adoption of emerging technologies such as mobile and blockchain.

Below are more details about some key projects:

Enclave Wallet • Software Engineer | Product Owner | UI/UX Designer • Jun 2024 - Feb 2025

Enclave is an application for secure digital asset management, built so non-technical users can onboard as smoothly as in a traditional web app. It combines Abstract Accounts, WebAuthn authentication and sponsored transactions. In a small team, I owned the product vision, usability and the entire frontend, and contributed to the backend services it relies on.

<https://enclavewallet.com>

Blockchain Services Library • Software Engineer | Techlead • Aug 2023 - Jul 2024

BSLib is a multi-network TypeScript SDK that exposes common asset-management operations behind a single generic API, normalizing the characteristics of each underlying network. It ships implementations for Neon3, NeoLegacy and EVM networks, and runs in production in desktop and mobile applications. As its creator, I designed the abstraction to maximize code reuse across my team's products.

Letter • Software Engineer | TechLead • Feb 2022 - Apr 2023

In partnership with the Associated Press, Dapper Labs and COZ, Letter is a distributed authentication platform that lets systems validate access in a decentralized manner. I architected the solution: services on both networks (Neo and Flow), a reusable SDK that integrates both simultaneously behind one interface, and several key integrations.

Neon Wallet • Software Engineer | TechLead • July 2021 - July 2024

Led the architecture of a production mobile application for secure digital asset management, with over \$1 billion in traded volume, and later contributed to its desktop counterpart. Responsibilities included application architecture, backend and API integration, multi-network connectivity, secure authentication, managing multiple accounts simultaneously, WalletConnect integration, the protocol for network communication, and performance optimization.

LDC's She Digital • Software Engineer | TechLead • Oct 2019 - Nov 2020

Louis Dreyfus Company, one of the largest commodity traders in the world, commissioned the development of a 'Safety, Health, and Environment' management platform for use across all its global units. I architected and developed this project entirely. The platform included integrations with Azure Active Directory for authentication and user management. The most significant challenge was translating all the company's needs into a flexible application that could scale without requiring code modifications.

iTrack • Software Engineer | TechLead • Nov 2016 - Jun 2018

iTrack Brasil is a B2B delivery services platform, integrating multiple systems, with nearly 60,000 couriers. Key challenges included various integrations and optimizing large data volumes. With over 50 million invoices and 2,000 companies registered, the platform's growth was further boosted by its acquisition by MadeiraMadeira in 2021.

Apptite • Software Engineer | TechLead • Sep 2015 - July 2017

Apptite was a food delivery app for iOS, Android and the web. It gained recognition with acceleration by '500 Startups'. With media coverage, it established itself as an important platform in the artisanal food market. I was the main responsible for the initial planning, structuring and development of the platform.

Multilaser Runin • Software Engineer • Aug 2014 - Oct 2014

Multilaser, one of Brazil's largest cell phone and tablet manufacturers, faced high demand for quality control tests, which were previously done manually. I helped develop an Android application to automate these tests, covering CPU, RAM, GPS, screen brightness, and touch functionality. This automation significantly improved productivity in tablet production, and the app has since tested over 20 million devices.

SIMET - NIC.br • Software Engineer • 2010 - 2013

At NIC.br, I worked on applications for SIMET, an internet quality measurement tool. I proposed and designed a new version of the main SIMET application, transitioning from Java Applet to JavaScript. I developed SimetMapas, visualizing internet quality heat maps across Brazil, and created dashboards for internet operators and regulatory agencies. Additionally, I helped develop SimetBox, a Wi-Fi router for automatic tests, and an Android app for quality testing with a custom graphics library.

Academic Qualifications

Pontifícia Universidade Católica de São Paulo (PUC-SP) • Bachelor, Computer Science • 2008 - 2011

Bachelor's degree in Computer Science from Pontifícia Universidade Católica de São Paulo, one of Brazil's leading higher education institutions.
